

advertisement, transmitted via a subscriber's line or a wireless channel from the private branch exchange or the base station;

- B1 cont*
- (c) a switching circuit for converting between transmitting mode and a memory mode according to the user's selection;
 - (d) a memory unit for pre-storing the information such as music, voice, or images for advertisement in the built-in memory; and
 - (e) an output unit, comprising a speaker, a microphone and a display device, the output unit being arranged for outputting the voice of said call-processing unit, and the information signal of said information signal processing unit, and said memory unit.
-

B2

4. (Amended) A communication terminal according to Claim 2, wherein said output unit is arranged for reproducing, via said speaker or microphone, the signals or the information such as music, voice or images for advertisement, inputted via said information signal processing unit, according to the mode of said switching circuit.

5. (Amended) A communication terminal according to Claim 2, wherein said output unit is arranged for displaying, via said display device, the signals or the information such as music, voice or images for advertisement, inputted via said information signal processing unit, according to the mode of said switching circuit.

6. (Amended) A communication terminal according to Claim 2, wherein said output unit is arranged for reproducing, via said speaker or microphone, the signals or the information such as music, voice or images for advertisement, pre-stored in said memory part, according to the mode of said switching circuit.

7. (Amended) A communication terminal according to Claim 2, wherein said output unit is arranged for displaying, via said display device, the signals or the information such as music, voice or images for advertisement, pre-stored in said memory unit, according to the mode of said switching circuit.

8. (Amended) A communication terminal according to Claim 3, wherein said output unit is arranged for reproducing, via said speaker or microphone, the signals or the information such as music, voice or images for advertisement, pre-stored in said memory unit, according to the mode of said switching circuit.

9. (Amended) A communication terminal according to Claim 3, wherein said output unit is arranged for displaying, via said display device, the signals or the information such as music, voice or images for advertisement, pre-stored in said memory unit, according to the mode of said switching circuit.

10. (Amended) A communication terminal according to Claim 9, wherein said output unit is arranged for reproducing, via said speaker or microphone, the signals or the information such as

music, voice or images for advertisement, pre-stored in said memory part, according to the mode of said switching circuit.

B2 cont
11. (Amended) A communication terminal according to Claim 7, wherein said output unit is arranged for displaying, via said display device, the signals or the information such as music, voice or images for advertisement, pre-stored in said memory part, according to the mode of said switching circuit.

12. (Twice Amended) A communication terminal according to Claim 2, wherein said output part is arranged for reproducing, via said speaker or microphone, the signals or the information such as music, voice or images for advertisement, inputted via said information signal processing unit, according to the mode of said switching circuit, and displays the information of images for advertisement on said display device.

13. (Twice Amended) A communication terminal according to Claim 2, wherein said output part is arranged for reproducing, via said speaker or microphone, the information such as music, voice or images for advertisement, pre-stored in said memory unit, according to the mode of said switching circuit, and displays the information of images for advertisement on said display device.

14. (Amended) A method of advertising by using a communication terminal, which comprises the steps of:

pre-storing music, voice or image information for advertisement as a call signal in a computer installed at a private branch exchange or a base station;

B2
cont detecting whether a dial signal has been inputted to the exchanger of said private branch exchange or base station from an originating communication terminal;

selecting, according to said dial signal, as to whether the dial signal is associated with a call within the private branch exchange or the same base station, or a call from the other exchanging network or base station;

transmitting a ring-back tone to an answering communication terminal while simultaneously transmitting the information pre-stored in the computer, to the originating communication terminal by a call signal;

reproducing the information as an answer tone via a speaker of said answering communication terminal; and

repetitively executing or terminating the step according to the answer signal transmitted to the private branch exchange or the base station from the answering communication terminal.

B3 17. (Amended) The advertising method according to Claim 15, wherein said step comprises reproducing the information as an answer tone signal via said speaker on the answering communication terminal.

Serial No. 09/980,017

18. (Amended) The advertising method according to Claim 16, wherein said step comprises displaying the information via said display device on the answering communication terminal.

*B3
cont*
19. (Twice Amended) The advertising method according to Claim 15, wherein said step comprises reproducing the information as an answer tone via said speaker on the answering communication terminal, while simultaneously displaying the advertisement information via said display device on the answering communication terminal.
